Agenda

1. Context: brief overview of dementia and diabetes
2. Objective of the studies
3. Methods: Rush Alzheimer's Disease Center (RADC) cohorts and data
4. Select results:
   a. Published results on diabetes, cognition, and neuropathology
   b. Works in progress
5. Conclusions

4

Context:
Complex diseases with large public health impact

5

DEMENTIA

- All-cause dementia (most commonly attributed to Alzheimer's disease or Vascular Dementia, but most often mixed pathologies):
  - 47 million persons worldwide, mostly elderly
  - Projected to affect 131 million by 2050
- Dementia = enormous and rapidly growing public health and societal burden worldwide
  →urgent need for more effective approaches to address

Alzheimer's Disease International 2015

Diagnosis and Management of Dementia: Review

Zoe Arvanitakis, MD, MS; Raj C. Shah, MD; David A. Bennett, MD

JAMA 2019

6

A potentially modifiable risk factor for dementia: DIABETES MELLITUS (DM)

- Epidemiology of DM in the US:
  - 7th leading cause of death (CDC)
  - Associated with significant medical, psychological, and societal costs
  - Very common, especially with aging: affects 1/5 older persons
  - Increasingly common
  - Potential times of intervention at all stages: no insulin resistance (normal), pre-diabetes stage, and frank diabetes (especially if early stage)

- Clinical data linking DM with
  - Cognitive impairment and cognitive decline
  - More recent large epidemiologic studies consistently showing there is a **TWO-FOLD increased risk of dementia**

8

OBJECTIVE: To elucidate the relation of

diabetes and insulin resistance
to
brain structure and function (cognition)

9

Methods:
RADC cohorts and data

10

Cohorts at the Rush Alzheimer's Disease Center (RADC)

Select Rush prospective, longitudinal, clinical-pathologic, community-based cohort studies of aging:

- Religious Orders Study (ROS)
- Rush Memory and Aging Project (MAP)
- Minority Aging Research Study (MARS)

11

Religious Orders Study (ROS)

- Began in 1993
- Funded by the National Institute on Aging
- > 1,497 older nuns, priests, and brothers without known dementia from >40 groups across the US
- All agreed to annual cognitive and motor testing
  - Complete neurological evaluation performed annually
  - > 95% follow-up of survivors with up to 29 time points
  - > 430 persons have developed dementia
- All agreed to brain donation at the time of death
  - > 90% autopsy rate with > 876 brain autopsies

12

12

Memory and Aging Project (MAP)

- Began in 1997
- Funded by the National Institute on Aging
- > 2,275 residents from about 40 retirement communities and senior housing from across the Chicago area
- All agreed to annual cognitive and motor testing, and blood draw
  Complete neurological evaluation performed annually
  > 90% follow-up of survivors with up to 25 time points
- All agreed to donate brain, spinal cord, muscle, and nerve at the time of death
  > 85% autopsy rate with > 1033 brain autopsies

13

13

The Minority Aging Research Study (MARS)

- Began in 2004
- Funded by the National Institute on Aging
- > 816 older community-dwelling African Americans without known dementia, living in private residences or senior housing across the Chicagoland area
- All agreed to annual cognitive testing
- More recently, invited to participate in brain donation at time of death

- Working memory
- Perceptual speed
- Visuospatial ability

CLINICAL DIAGNOSES:

Dementia
Alzheimer's disease
Mild cog impairment

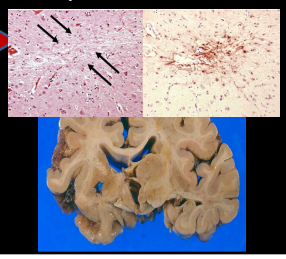
Wilson et al., Psych Aging 2002
Barnes et al., JINS 2016

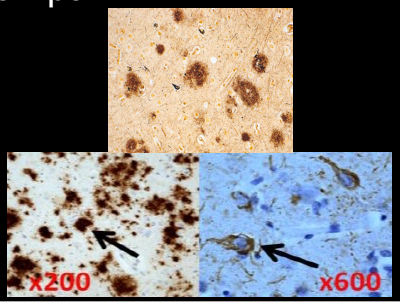
17

17

Neuropathology

- Standardized procedure, blinded to clinical data
  - mean post-mortem interval = 8 hrs
- Alzheimer's disease (level, diagnostic criteria)
- Other common pathologies, including
  - Neurodegenerative (Lewy bodies, hippocampal sclerosis, LATE, other)
  - Vascular
  - Other





18

Diabetes (DM) data in RADC cohorts

- Assessed at baseline and annually by
  - medical history (4 questions), and
  - visual inspection of all medications (which identify use of insulin and oral hypoglycemic agents) which are recorded and coded using MediSpan
- HbA1c in blood started being collected in 2008
- Sister studies collect additional related measures in the human brain, blood, and muscle

19

Visuospatial ability	-0.668 (0.940)	-0.640 (0.914)	-0.697 (0.97)
NEUROPATHOLOGIC			
Alzheimer's disease pathology			
Global score, median (SD)	0.6 (0.6)	0.7 (0.6)	0.6 (0.5)
Amyloid score, median (SD)	1.6 (0.2,4.5)	2 (0.3,5.3)	1.4 (0.2,4.1)
Tangles score, median (SD)	3.2 (1.2,7.4)	3.5 (1.1,7.8)	2.7 (1.2,7)

*Mean (SD), unless otherwise specified
**Cognitive data proximate-to-death

RESULTS

While no other molecular measures were significant, brain pT^{308} AKT1/total AKT1 (by ELISA) was associated with

More AD pathology:
- Global measure
- Amyloid burden
- Tangle density

Lower cognition:
- Global cognition (proximate to death)

Subjects with and without diabetes were matched by age and sex (n= 150)

24

24

Overall

LIMITATIONS

- Diabetes not well characterized
- Conditions are complex (metabolic syndrome)
- Pathophysiologic mechanisms linking diabetes to dementia needs further elucidation, including mediation effects
- Observational study with cross-sectional design does not establish causation

STRENGTHS

- Prospective design with up to 29 years of annual follow-up in large cohorts of community-dwelling older persons
- High follow-up rates (90-95% range)
- Detailed neuropsychologial test data with summary measures of global cognition/domains, and dementia classification
- High autopsy rates (85-90% range), with systematically-collected neuropathologic data

25

25

Works in Progress

26

Peripheral and central (brain) insulin signaling

RF1 AG059621 (PABIR) (data collection ongoing)

- Overall goal:
  - to examine associations of peripheral (serum, muscle) with central (brain) insulin resistance, and
  - the associations of peripheral and central insulin resistance with AD neuropathology and cognitive function
- Design: Using MAP biospecimens and data, collect ELISA measures and untargeted proteomics and phosphoproteomics, and other measures

27

27

Metformin, cognitive function, and brain pathology

R01 NS084965 (BIRA) and RF1 AG059621 (PABIR)

(Sood A. et al., manuscript in preparation)

28

Metformin, cognitive function, and brain pathology

(Sood A. et al., manuscript in preparation)
Subjects from ROSMAPMARS

RESULTS

In total samples of 4126 older persons followed annually for a mean of 8.2 years, metformin users had (compared to non-users):

- a lower baseline level of global cognition (estimate= -0.067, SE=0.028, p=0.018)
- improving cognition over time (estimate= 0.0114, SE=0.0055, p=0.0401)

Autopsy subset of 1715 deceased persons (average age at death 89.6 years), we found in metformin users vs not:

- no difference in AD pathology
- for CVD pathology: less atherosclerosis (estimate= -0.505, SE= 0.165, p=0.002) and increased subcortical infarcts (estimate 0.484, SE= 0.171, p=0.005)

CONCLUSIONS: Complex relation of metformin with brain health (cognition and pathology)

29

29

Epigenetic marker

RF1 AG074549 (REVA)

- Overall goal: to elucidate epigenetic mechanisms linking vascular risk factors (DM, BP, and BMI) to AD/ADRD clinical and pathological phenotypes, in older Whites and Blacks
- Design: discovery and validation of 5hmC scores in serum and brain, elucidation of biologic pathways and racial differences in DM and dementia (using MAP and MARS cohorts)

30

30

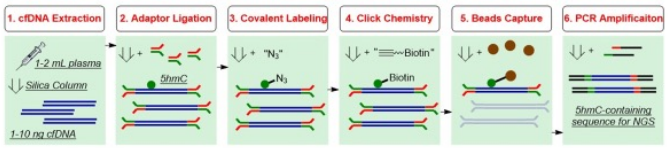
Feasibility study: Genome-wide Mapping Implicates 5-Hydroxymethylcytosine (5hmC) in Diabetes Mellitus (DM) and Alzheimer's Disease (AD)

(Beadell A. et al., manuscript in preparation)
Subjects from MAPMARS

METHODS:

- **80 deceased MAP individuals across four groups: AD-only (neuropathologically defined), DM-only (clinically defined), AD with DM (AD+DM), and non-AD/non-DM controls**
- **5hmC-Seal: a highly sensitive chemical labeling technique we developed, which pulls down 5hmC containing DNA fragments, and uses NGS to capture the t5hmC signals on the genome**
- **Genome-wide profiling of 5hmC in circulating cell-free DNA (cfDNA) from antemortem serum samples and brain tissue genomic DNA (gDNA) from postmortem prefrontal cortex tissue**
- **Differential analysis and machine learning (elastic net regularization and multivariate logistic regression) to explore whether 5hmC might be implicated in DM-associated AD, and which biological pathways are involved**

Summary of nano-hmC-Seal steps to measure 5hmC in cfDNA

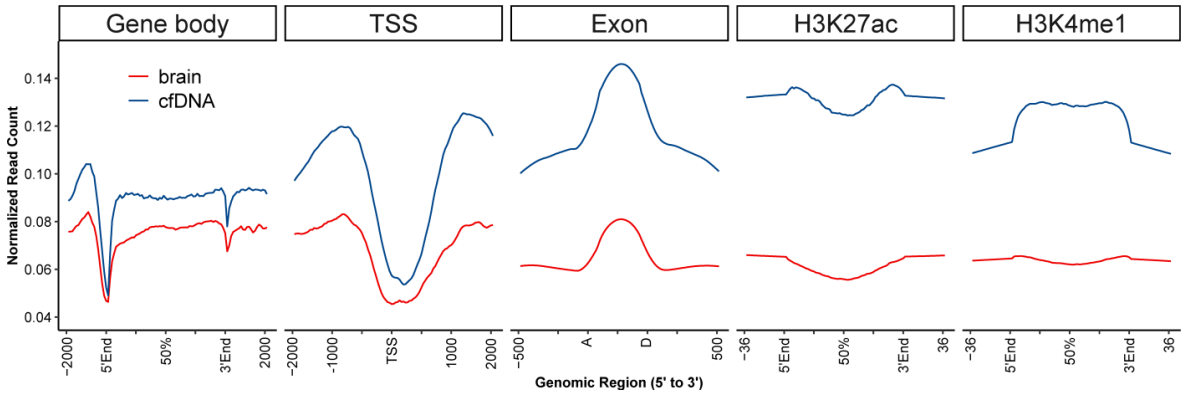


RUSH

31

32

Overview of the capture of 5hmC



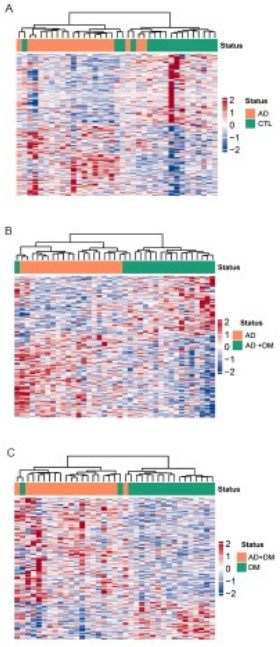
5hmC in both serum (cfDNA) and brain (gDNA) has gene regulatory relevance:
-most captured 5hmC fragments are enriched in the gene bodies, relative to the flanking regions
-the captured 5hmC fragments are co-localized with two histone modification (enhancer) marks

32

Differential analysis

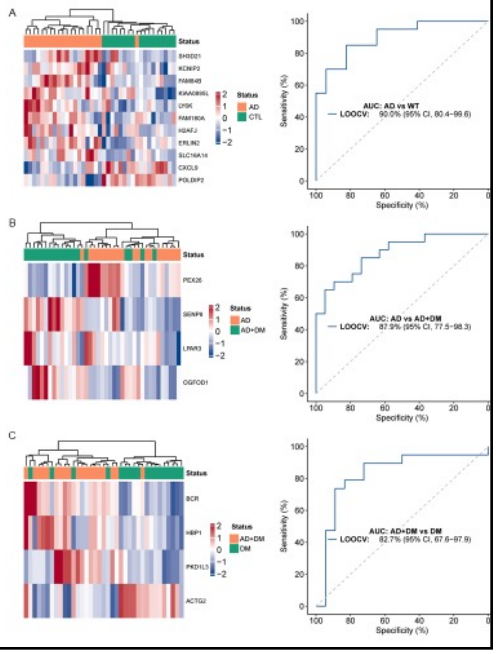
RESULTS
cfDNA

Modeling



Machine learning

Elastic net regularization and multivariable logistic regression with the LOOCV (leave-one-out cross-validation) approach



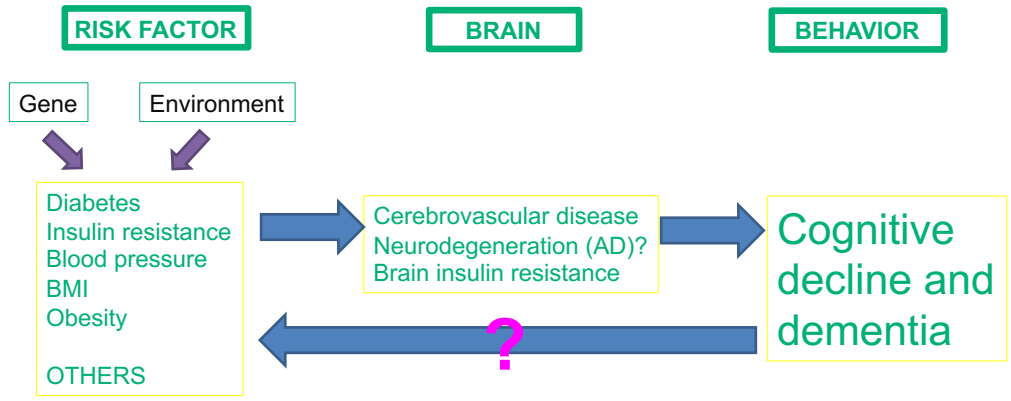
5%FDR

33

Conclusions

34

Overly simplified conceptual framework



35

Future directions

- Disentangle underlying mechanisms of dementia using these and other techniques, including
  - genetic, epigenetic, -omics, and other state of the science methods
  - environmental (exposome), social determinants of health, racioethnic and other factors with qualitative and quantitative methods
- Identify therapeutic targets and test treatments and prevention approaches (clinical trials)
- Need integrative approaches

36

36

Question for the audience:

Looking for a position to work with human biospecimens and data?

Postdoc, Research Scientist, and other positions available

Zoe_Arvanitakis@rush.edu

https://www.radc.rush.edu/

The Rush Alzheimer's Disease Center (RADC), one of 29 Alzheimer's disease (AD) Research Centers across the country designated and funded by the National Institute on Aging (NIA), is dedicated to supporting research about the cause, treatment, and prevention of AD, other dementias, and a range of other common chronic conditions of aging. The many RADC studies generate an enormous variety of unique data and biospecimens to support this effort. RADC faculty and staff are committed to sharing these resources with the wider aging and AD research community to accelerate the pace at which new knowledge is created for the treatment and prevention of dementia and other age-related chronic neurologic conditions, and have distributed data across the United States and the world.

37
